

Kuda 3.0

Confidence Layer

Feature Specification Document

Six prioritized feature improvements translated from the senior product teardown into delivery-ready feature packages.

PRODUCT THESIS

Kuda 3.0 has largely solved the old discoverability problem. The next product advantage is confidence: money states, exception journeys, support ownership and recurring commitments should be clear enough that customers do not have to chase the app for answers.

Prepared by	Olusola Ayodeji Ezekiel Product Manager
Document status	Version 1.0 Independent product proposal

Independent concept based on public product observations and prior teardown work. Not affiliated with or endorsed by Kuda.

How to Read This Document

This feature document sits between strategy and delivery. It translates the teardown into six prioritized feature packages, each with a customer problem, experience intent, functional scope, technical notes, success measures and rollout position. The first three are foundational. The final three should be piloted after state and data quality are proven.

FEATURE 01

Transaction Confidence & Resolution

Priority	Customer value	Business value	Delivery profile
P0	High	High	Medium to Medium-High

Customer problem Customers can understand a transaction label without understanding what happens next, who owns the recovery, or when they should expect another update.

Why it matters Reduce money anxiety, repeat transfer attempts and avoidable support demand.

Proposed feature scope

- In-transaction resolution timeline
- Ownership and next-action language
- ETA band or checkpoint
- Automatic escalation after recovery window
- Attached case history
- Incident-aware messaging

PRIMARY USER STORY

As a customer with a delayed or failed transfer, I want to see the stage, owner and next checkpoint so I do not retry or chase support unnecessarily.

Acceptance criteria

- Every exception state has one explanation and one next step.
- Terminal UI state requires ledger/payment confirmation.
- Escalation carries state history and timestamps.
- Low-confidence ETA falls back to checkpoint.
- Material updates notify once; duplicates suppressed.

Technical product notes

- Canonical transaction state machine
- Durable status events
- Idempotent retry and escalation
- SLA metadata separated from ledger truth
- State-dwell and retry instrumentation

Success measures

- Contact rate per exception
- Repeat attempt rate
- Self-service resolution
- Exception CSAT
- Time to explanation

Release position Start now. This is the anchor feature for the confidence thesis because the problem is concrete, high-stakes and measurable.

FEATURE 02

Contextual Support & Incident Recovery

Priority	Customer value	Business value	Delivery profile
P1	High	High	Medium to Medium-High

Customer problem Support is easier to reach in Kuda 3.0, but a customer can still arrive at support without the context of the product object that caused the problem.

Why it matters Lower customer effort and cost-to-serve while making case ownership visible.

Proposed feature scope

- Get help with this object entry points
- Secure context envelope
- Case status in Inbox
- Known-incident banner
- Asynchronous callback for non-urgent support
- Duplicate case prevention

PRIMARY USER STORY

As a customer needing help with a specific money issue, I want support to already understand the context and show who owns the next step.

Acceptance criteria

- Contextual entry passes a secure reference.
- Latest case state and next update are visible without reopening chat.
- Known incidents appear before ticket creation.
- Active cases offer follow instead of duplicate creation.
- Sensitive data is minimized or redacted by role.

Technical product notes

- Context-envelope contract
- RBAC-aware case creation
- Machine-readable incident service
- Audit trail for enrichment
- Ticket-origin and handoff instrumentation

Success measures

- First-contact resolution
- Repeat-contact rate
- Duplicate-ticket rate
- Customer Effort Score
- Time to meaningful update

Release position Start in the same 90-day program as the P0 confidence work because this capability reduces customer effort and prevents parallel truths across product and support surfaces.

FEATURE 03

Money-State Reliability

Priority	Customer value	Business value	Delivery profile
P1	High	High	Medium to Medium-High

Customer problem As Kuda expands Spend, pending transactions, budgets, savings, investments and overdraft, inconsistent or stale state explanations can create trust debt.

Why it matters Create one understandable financial truth across product surfaces before adding broader prediction or personalization.

Proposed feature scope

- Shared labels for current, available, pending, savings, investment and credit states
- Freshness and last-updated explanations
- Inline explanation of material differences
- Budget/history category reconciliation
- Overdraft repayment posting states
- Same explanations in support tooling

PRIMARY USER STORY

As a customer managing spending, savings or overdraft, I want all balances and availability states to reconcile so I know how much I can safely use.

Acceptance criteria

- Every money value has source, freshness rule and label.
- Pending/reserved funds never silently appear as available.
- Budget totals reconcile to transaction categorization.
- Overdraft repayment shows received -> applied -> credit refreshed.
- Support sees the same customer-safe explanation.

Technical product notes

- Shared money-state taxonomy
- Ledger vs derived-state separation
- Freshness metadata
- Reconciliation monitors
- Displayed-state version in analytics

Success measures

- Discrepancy reports
- State-freshness SLA
- Budget reconciliation accuracy
- Overdraft refresh time
- Task success: how much can I spend now?

Release position Start in the same 90-day program as the P0 confidence work because this capability reduces customer effort and prevents parallel truths across product and support surfaces.

FEATURE 04

Home 3.0 Contextual Priority Rail

Priority	Customer value	Business value	Delivery profile
P1 Pilot	High	High	Medium to Medium-High

Customer problem The new home is cleaner. The risk is undoing that improvement by filling it with personalization and promotional cards.

Why it matters Make the home helpful at high-signal moments without turning it into a feed.

Proposed feature scope

- Maximum one primary contextual card
- Risk or obligation outranks offers
- Privacy-aware visibility
- Pin / Hide / Mute / Why am I seeing this?
- Secondary shortcut adaptation only after confidence
- Standard-home fallback

PRIMARY USER STORY

As a Kuda customer, I want the home screen to surface the one thing that genuinely needs attention without exposing sensitive information or constantly rearranging itself.

Acceptance criteria

- One priority card maximum.
- Risk or obligation outranks promotion.
- Privacy preferences apply across relevant preview surfaces.
- Hide/mute available without deep settings.
- Core Send/Pay actions remain stable.

Technical product notes

- Server-configurable ranking policy
- Minimal derived eligibility signals
- Auditable feature flags
- Fast preference propagation
- Exposure, dismiss and outcome instrumentation

Success measures

- Time-to-action
- Priority-card action rate
- Dismiss/hide rate
- Privacy-control adoption
- No increase in opt-out or complaints

Release position Pilot only after the foundational state and event work is stable. Keep the initial intent set narrow and validate comprehension before expanding.

FEATURE 05

Search 2.0

Priority	Customer value	Business value	Delivery profile
P1 Pilot	High	High	Medium to Medium-High

Customer problem Global search helps customers find features, but the next value is trustworthy retrieval and summary of the customer's own financial history.

Why it matters Reduce transaction-retrieval time and turn search into a bounded financial understanding tool without introducing unbounded response risk.

Proposed feature scope

- Natural-language transaction retrieval
- Deterministic financial summary queries
- Navigation queries
- Inspectable source transactions
- Editable category context
- Read-first guardrail

PRIMARY USER STORY

As a customer, I want to search Kuda using how I naturally remember my money and tasks so I can get a trustworthy answer without knowing the app architecture.

Acceptance criteria

- Financial totals computed from ledger-backed records.
- Action queries route to secure product flows.
- Summary answers expose included transactions.
- Category-dependent answers show context.
- Low-confidence queries fall back safely.

Technical product notes

- Intent interpretation separated from financial computation
- Permission-scoped retrieval
- Normalized search index
- Audit of intent, filters and result IDs
- Confidence monitoring

Success measures

- Search success
- Reformulation rate
- Time to retrieve receipt
- Search-to-action conversion
- Fallback rate

Release position Pilot only after the foundational state and event work is stable. Keep the initial intent set narrow and validate comprehension before expanding.

FEATURE 06

Recurring Money Hub

Priority	Customer value	Business value	Delivery profile
P1 Prototype	High	High	Medium to Medium-High

Customer problem Bills, Direct Debit mandates, savings debits and repayments exist as separate product objects, making future cash outflow harder to understand.

Why it matters Help customers plan recurring commitments while clearly separating confirmed obligations from detected patterns.

Proposed feature scope

- Recurring Money calendar
- Mandate cards
- Detected subscription confirmation
- Projected available-to-spend after commitments
- Smart reminders
- Historical recurring outflow view

PRIMARY USER STORY

As a customer with recurring bills and mandates, I want one reliable view of what is expected to leave my account and what I can control in Kuda.

Acceptance criteria

- Confirmed mandates differ visually from detected patterns.
- Projections never reduce actual available balance.
- Cancellation ownership is accurate.
- Detected items can be corrected or dismissed.
- Reminder preferences and deduplication are respected.

Technical product notes

- Actual mandate registry
- Pattern detection with confidence and evidence
- Forecast service using approved obligations
- Event-driven idempotent notifications
- Feedback instrumentation for pattern accuracy

Success measures

- Discovery / confirmation rate
- Mandate-detail usage
- Reminder conversion
- Missed recurring payment rate where observable
- False-positive dismissal rate

Release position Prototype with confirmed mandate data first. Add inferred recurring items only after precision testing and customer confirmation behavior are understood.

Recommended Delivery Sequence

The six features should be sequenced around dependency and trust. Foundational state and recovery capabilities come first; adaptive and insight-led experiences follow only after the underlying data and event model is stable.

Sequence	Feature set	Delivery intent
1 - Foundation	Transaction Confidence & Resolution; Contextual Support; Money-State Reliability	Establish one trusted state model, exception recovery path and consistent customer explanation.
2 - Controlled pilots	Home 3.0 Contextual Priority Rail; Search 2.0	Introduce adaptive experiences with narrow scope, explicit guardrails and measurable comprehension.
3 - Planning layer	Recurring Money Hub	Bring confirmed commitments and carefully validated detected patterns into a single planning view.
